

Version1:

Before we start to design the prototype, we first communicate with our clients for many times and we are able to clearly understand their needs and requirements. In our prototype, we have already realize the basic function such as order providers are able to submit an order, check the order detail information, change personal information and so forth. The following photos are the first version of the order provider end app.

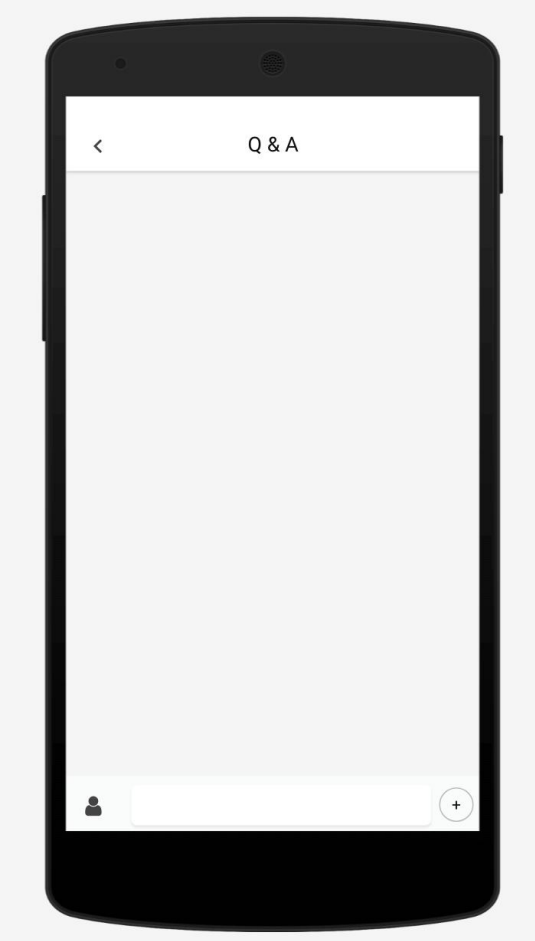

The main function in main page is that order providers can first fill out some information, then submit an order and the order will be confirmed if they click the button in the confirm page. Beside it also allow order provider to locate their position and communicate with staffs if they meet some problems by click the top two images in the prototype.

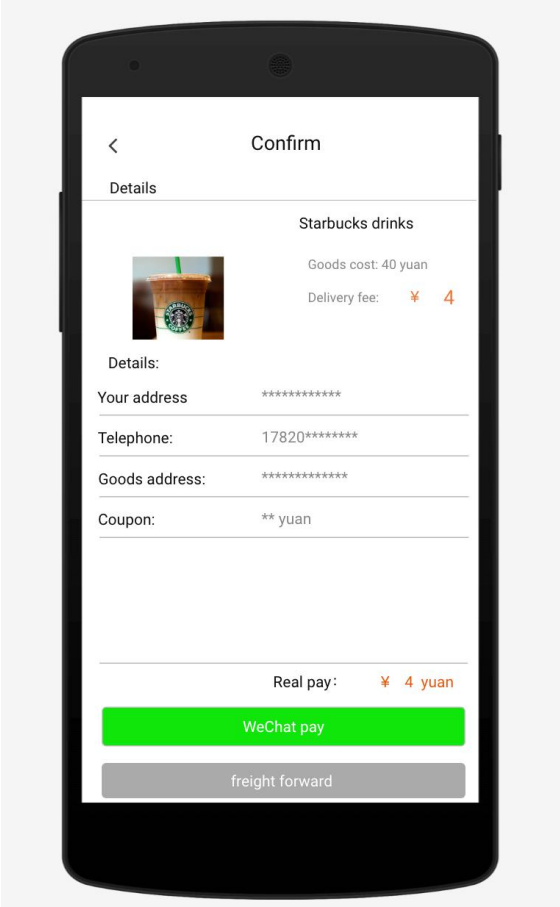

main page

location page

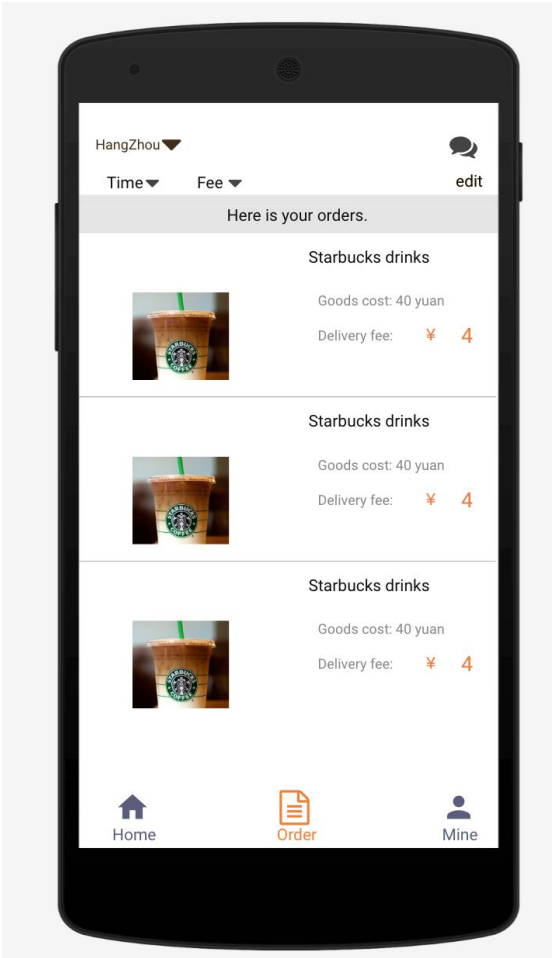

online chatting page

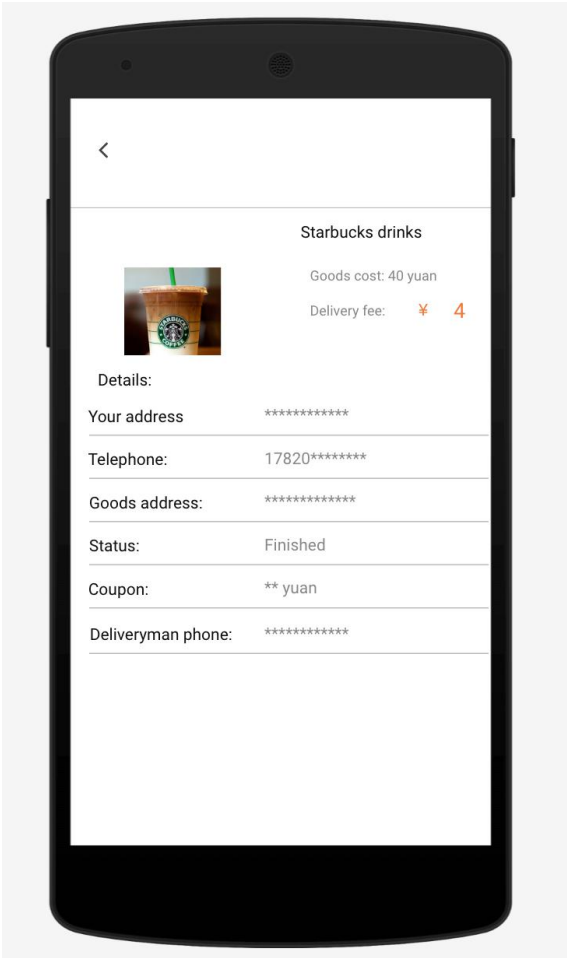

confirm page

As for the order page, order providers are able to view the orders that they have submitted . What's more, they can also click them to get more details including the deliveryman's information and order's status.

In the mine page, some personal information are viewed in this page.

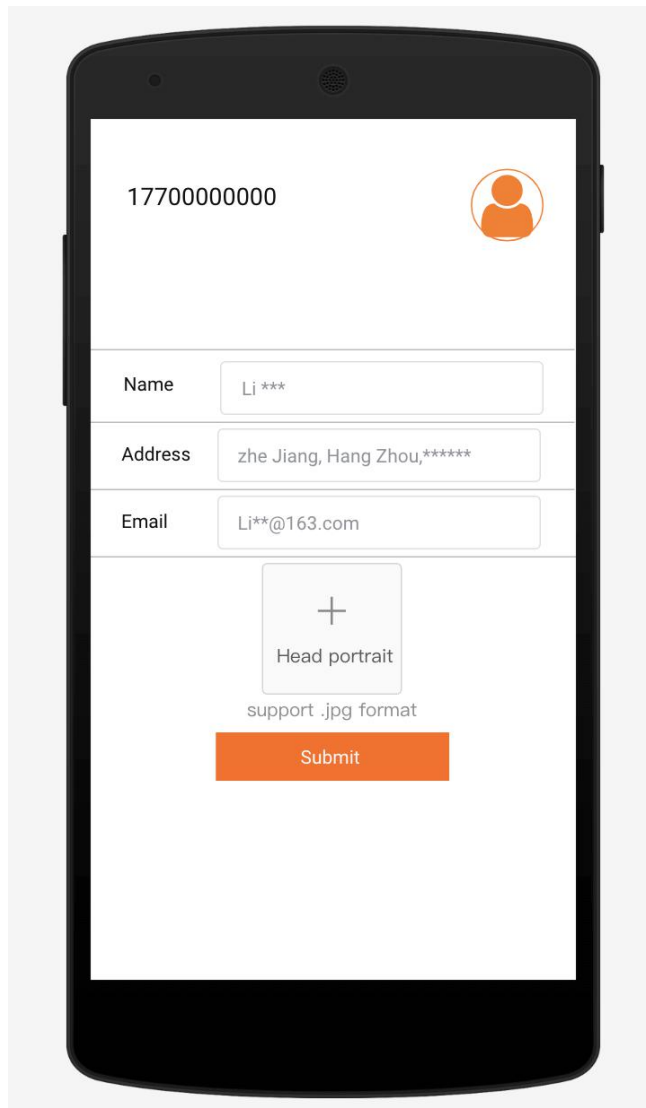

mine page

Version2:

After showing our first prototype to clients, some useful feedback help us to complete better. Some clients think that our prototype design is quick compendious and clear and they think it is quick easy to operate and understand. However they also find some problems. The most mentioned problem is that the personal information can not be changed. Therefore compared with the first prototype, the second one add this function that allow order providers to change their personal information.

The following photo is the change personal information page. Order providers are able to click their portrait to get into this page. In this page, order providers are able to change their name, address, Email and portrait.

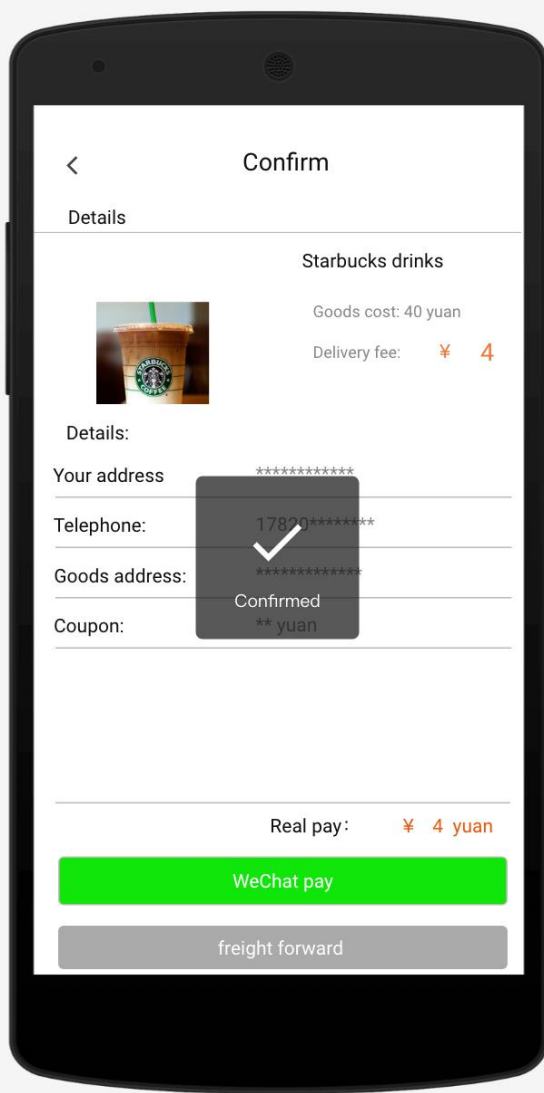

change personal information page

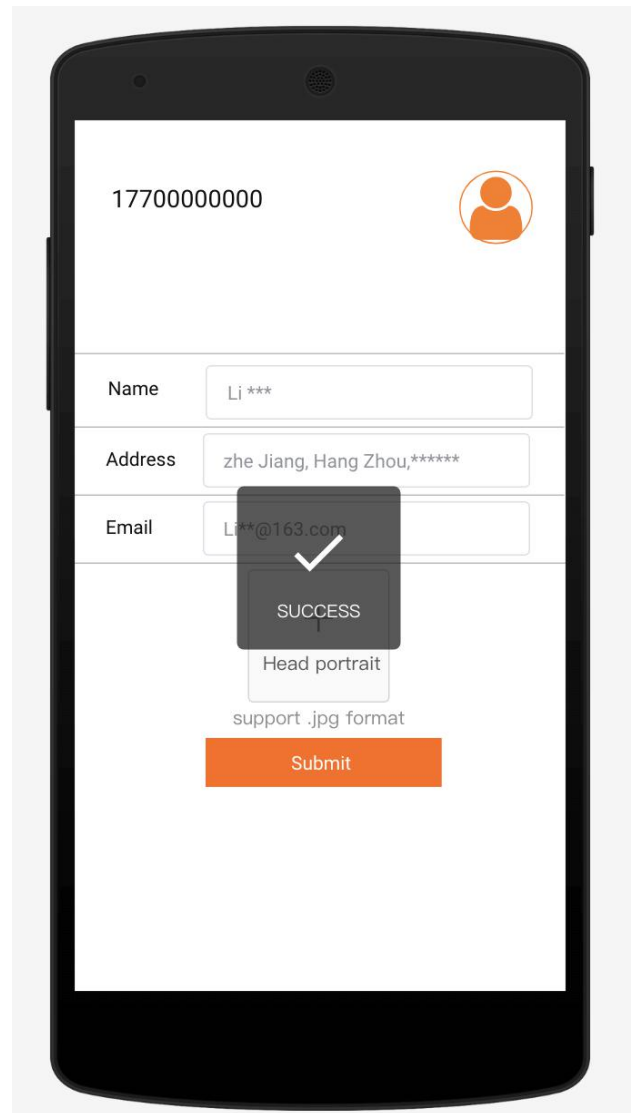

Version3:

Actually when we show our second prototype to clients, most of them are satisfied, since we already add the change personal information function and the whole prototype is quick completed and it is easy for them to use. Besides the whole design it also in great order and color is consistent and not complicated. However on the other hand, some clients also reckon that it would be better to have some hint to let it more intelligent to use.

Therefore we totally analyst our prototype and add some hint. The first hint is added in the confirm page. After order provider confirm the order, the system should return a success or fail message to the client. Beside the second hint is added in the change personal information page, when order providers already modify personal information and click the submit button, it would be better to return a hint to them so that order providers get to know the information is already changed.
